

ABSTRACT

The present invention is related with the field of dermatology and in particular with a solution that may be used in those of cosmetics and medicine, useful for the treatment of lesions caused by vitiligo. The amino acid L-Proline is the active principle of the subject composition of the present invention and it stimulates the synthesis of the skin melanic pigment as well as the reproduction of melanocytes. L-Proline does not cause severe side effects as demonstrated by toxicological and clinical studies performed. The technical objective of the present invention is to achieve a synthetic product, effective in the treatment of vitiligo, with no toxic effects or relapsing.
